1 Introduction

Theorem 1.1 (Complete Axiom). *Every nonempty subset S of $\mathbb{R}$ that is bounded above has a least upper bound. In other words, $\sup S$ exists and is a real number.*

2 Monotone Sequence and Cauchy Sequences

Theorem 2.1. *All bounded monotone sequences converge.*

Definition 2.2. *A sequence (s_n) of real numbers is called a Cauchy sequence if for each $\epsilon > 0$ there exists a number N such that $m, n > N$ implies $|s_n - s_m| < \epsilon$*

Lemma 2.3. *Convergent sequences are Cauchy sequences.*

Theorem 2.4. *A sequence is a convergent sequence if and only if it is a Cauchy sequence.*

sketch proof.
$$|s_n - s_m| = |s_n - s + s - s_m| \le |s_n - s| + |s - s_m|$$

$\square$

3 Limsup and Liminf

Corollary 3.0.1. *If $\lim \left| \frac{s_{n+1}}{s_n} \right|$ exists [and equals L], then $\lim |s_n|^{1/n}$ exists [and equals L].*

4 Uniform Continuity

Theorem 4.1. *Pass. ...*

5   Power Series

Given power series $\sum_{n=0}^{\infty} a_n x^n$

Theorem 5.1. *Given any (a_n), one of the following holds true:*

1. *The power series converges for all $x \in \mathbb{R}$*

2. *The power series converges only for $x = 0$*

3. *The power series converges for all x in some bounded interval centered at 0; the interval may be open, half-open or closed.*

Theorem 5.2. *Let*

$$\beta = \limsup |a_n|^{1/n} \quad and \quad R = \frac{1}{\beta}$$

Then

1. *The power series converges for $|x| < R$*

2. *The power series diverges for $|x| > R$*

Also notice that $\lim \left| \frac{a_{n+1}}{a_n} \right| = \beta$, therefore most of the time we will use $\lim \left| \frac{a_{n+1}}{a_n} \right|$ as it's easier to compute thatn β.

6   More on Uniform Convergence

Theorem 6.1. *Let (f_n) be a sequence of continuous functions on $[a, b]$, and suppose $f_n \to f$ uniformly on $[a, b]$. Then*

$$\lim_{n \to \infty} \int_a^b f_n(x) dx = \int_a^b f(x) dx$$

Definition 6.2. *A sequence (f_n) of functions defined on a set $S \subseteq \mathbb{R}$ is uniformly Cauchy on S if*

for each $\epsilon > 0$ there exists a number N such that
$|f_n(x) - f_m(x)| < \epsilon$ for all $x \in S$ and all $m, n > N$

Theorem 6.3. *Let (f_n) be a sequence of functions defined and uniformly Cauchy on a set $S \subseteq \mathbb{R}$. Then there exists a function f on S such that $f_n \to f$ uniformly on S.*

Theorem 6.4. *Consider a series $\sum_{k=0}^{\infty} g_k$ of functions on a set $S \subseteq \mathbb{R}$. Suppose each g_k is continuous on S and the series converges uniformly on S . Then the series $\sum_{k=0}^{\infty} g_k$ represents a continuous function on S.*

Theorem 6.5. *If a series $\sum_{k=0}^{\infty} g_k$ of functions satisfies the Cauchy criterion uniformly on a set S , then the series converges uniformly on S .*

Theorem 6.6. *Let (M_k) be a sequence of nonnegative real numbers where $\sum M_k < \infty$. If $|g_k(x)| \le M_k$ for all x in a set S, then $\sum g_k$ converges uniformly on S.*

Theorem 6.7. *Show that if the series $\sum g_n$ converges uniformly on a set S, then $\lim_{n \to \infty} \sup \{ |g_n(x)| : x \in S$
0

7 Differentiation and Integration of Power Series

Theorem 7.1. *Let $\sum_{n=0}^{\infty} a_n x^n$ be a power series with radius of convergence $R > 0$ [possibly $R = +\infty$]. If $0 < R_1 < R$, then the power series converges uniformly on $[-R_1, R_1]$ to a continuous function.*

Lemma 7.2. *If the power series $\sum_{n=0}^{\infty} a_n x^n$ has radius of convergence R, then the power series*

$$\sum_{n=1}^{\infty} n a_n x^{n-1}$$

and

$$\sum_{n=0}^{\infty} \frac{a_n}{n+1} x^{n+1}$$

also have radius of convergence R.

Theorem 7.3 (Abel's Theorem). *Let $f(x) = \sum_{n=0}^{\infty} a_n x^n$ be a power series with finite positive radius of convergence R. If the series converges at $x = R$, then f is continuous at $x = R$. If the series converges at $x = -R$, then f is continuous at $x = -R$.*

8 Basic Properties of the Derivative

Theorem 8.1. *Differentiability implies continuity.*

9 Mean Value Theorem

Theorem 9.1. *Let f be a continuous function on $[a,b]$ that is differentiable on (a,b). Then there exists [at least one] x in (a,b) such that*

$$f'(x) = \frac{f(b) - f(a)}{b - a}$$

Theorem 9.2 (Intermediate Value Theorem for Derivatives). *Let f be a differentiable function on (a,b). If $a < x_1 < x_2 < b$, and if c lies between $f'(x_1)$ and $f'(x_2)$, there exists [at least one] x in (x_1, x_2) such that $f'(x) = c$*

Theorem 9.3. *Let f be a one-to-one continuous function on an open interval I, and let $J = f(I)$. If f is differentiable at $x_0 \in I$ and if $f'(x_0) \neq 0$, then f^{-1} is differentiable at $y_0 = f(x_0)$ and*

$$\left(f^{-1}\right)'(y_0) = \frac{1}{f'(x_0)}$$

Corollary 9.3.1. *Let f be a differentiable function on (a,b) such that $f'(x) = 0$ for all $x \in (a,b)$. Then f is a constant function on (a,b).*

Corollary 9.3.2. *Let f and g be differentiable functions on (a,b) such that $f' = g'$ on (a,b). Then there exists a constant c such that $f(x) = g(x) + c$ for all $x \in (a,b)$.*

Theorem 9.4 (IVT for derivatives). *Let f be a differentiable function on (a, b). If $a < x_1 < x_2 < b$, and if c lies between $f'(x_1)$ and $f'(x_2)$, there exists [at least one] x in (x_1, x_2) such that $f'(x) = c$*

Theorem 9.5 (Rolle's Theorem). *Let f be a continuous function on $[a,b]$ that is differentiable on (a,b) and satisfies $f(a) = f(b)$. There exists [at least one] x in (a, b) such that $f'(x) = 0$*

10   Taylor's Theorem

Definition 10.1. *Taylor's Theorem:*

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!}(x - c)^k$$

Remainder:

$$R_n(x) = f(x) - \sum_{k=0}^{n-1} \frac{f^{(k)}(c)}{k!}(x - c)^k$$

Theorem 10.2 (Taylor's Theorem). *Let f be defined on (a,b) where $a < c < b$; here we allow $a = -\infty$ or $b = \infty$. Suppose the nth derivative $f^{(n)}$ exists on (a, b). Then for each $x \neq c$ in (a, b) there is some y between c and x such that*

$$R_n(x) = \frac{f^{(n)}(y)}{n!}(x - c)^n$$

Corollary 10.2.1. *Let f be defined on (a, b) where $a < c < b$. If all the derivatives $f^{(n)}$ exist on (a, b) and are bounded by a single constant C, then*

$$\lim_{n \to \infty} R_n(x) = 0 \quad \text{for all} \quad x \in (a, b)$$

Theorem 10.3 (Taylor's Theorem (another one)). *Let f be defined on (a, b) where $a < c < b$, and suppose the nth derivative $f^{(n)}$ exists and is continuous on (a, b). Then for $x \in (a, b)$ we have*

$$R_n(x) = \int_c^x \frac{(x - t)^{n-1}}{(n - 1)!} f^{(n)}(t) dt$$

Corollary 10.3.1. *If f is as in Theorem 31.5, then for each x in (a, b) different from c there is some y between c and x such that*

$$R_n(x) = (x - c) \cdot \frac{(x - y)^{n-1}}{(n - 1)!} f^{(n)}(y)$$

This form of R_n is known as Cauchy's form of the remainder.

Theorem 10.4 (Binomial Series Theorem). *If $\alpha \in \mathbb{R}$ and $|x| < 1$, then*

$$(1 + x)^{\alpha} = 1 + \sum_{k=1}^{\infty} \frac{\alpha(\alpha - 1) \cdots (\alpha - k + 1)}{k!} x^k$$

Theorem 10.5 (Newton's Method)**.** *Newton's method for finding an approximate solution to $f(x) = 0$ is to begin with a reasonable initial guess x_0 and then compute*

$$x_n = x_{n-1} - \frac{f(x_{n-1})}{f'(x_{n-1})} \quad for \quad n \geq 1$$

Theorem 10.6 (Secant Method)**.** *A similar approach to approximating solutions of $f(x) = 0$ is to start with two reasonable guesses x_0 and x_1 and then compute*

$$x_n = x_{n-1} - \frac{f(x_{n-1})(x_{n-2} - x_{n-1})}{f(x_{n-2}) - f(x_{n-1})} \quad for \quad n \geq 2$$

11 The Riemann Integral

Definition 11.1.

$$M(f, S) = \sup\{f(x) : x \in S\} \quad and \quad m(f, S) = \inf\{f(x) : x \in S\}$$

A partition of $[a, b]$ is any finite ordered subset P having the form

$$P = \{a = t_0 < t_1 < \cdots < t_n = b\}$$

The upper Darboux sum $U(f, P)$ of f with respect to P is the sum

$$U(f, P) = \sum_{k=1}^{n} M(f, [t_{k-1}, t_k]) \cdot (t_k - t_{k-1})$$

and the lower Darboux sum $L(f, P)$ is

$$L(f, P) = \sum_{k=1}^{n} m(f, [t_{k-1}, t_k]) \cdot (t_k - t_{k-1})$$

Lemma 11.2. *Let f be a bounded function on $[a, b]$. If P and Q are partitions of $[a, b]$ and $P \subseteq Q$, then*

$$L(f, P) \leq L(f, Q) \leq U(f, Q) \leq U(f, P)$$

.

Lemma 11.3. *If f is a bounded function on $[a, b]$, and if P and Q are partitions of $[a, b]$, then $L(f, P) \leq U(f, Q)$*

Theorem 11.4. *A bounded function f on $[a, b]$ is integrable if and only if for each $\epsilon > 0$ there exists a partition P of $[a, b]$ such that*

$$U(f, P) - L(f, P) < \epsilon$$

Definition 11.5. *The mesh of a partition P is the maximum length of the subintervals comprising P. Thus if*

$$P = \{a = t_0 < t_1 < \cdots < t_n = b\}$$

then

$$\text{mesh}(P) = \max\{t_k - t_{k-1} : k = 1, 2, \ldots, n\}$$

Theorem 11.6. *A bounded function f on $[a, b]$ is integrable if and only if for each $\epsilon > 0$ there exists a$\delta > 0$ such that*

$$\text{mesh}(P) < \delta \quad implies \quad U(f, P) - L(f, P) < \epsilon$$

for all partitions P of $[a, b]$.

Definition 11.7. *The function f is Riemann integrable on $[a, b]$ if there exists a number r with the following property. For each $\epsilon > 0$ there exists $\delta > 0$ such that*

$$|S - r| < \epsilon$$

for every Riemann sum S of f associated with a partition P having $\text{mesh}(P) < \delta$.

Theorem 11.8. *A bounded function f on $[a, b]$ is Riemann integrable if and only if it is [Darboux] integrable, in which case the values of the integrals agree.*

Corollary 11.8.1. *Let f be a bounded Riemann integrable function on $[a,b]$. Suppose (S_n) is a sequence of Riemann sums, with corresponding partitions P_n, satisfying $\lim_n \text{mesh}(P_n) = 0$. Then the sequence (S_n) converges to $\int_a^b f$.*

Theorem 11.9. *Every monotonic function f on $[a, b]$ is integrable.*

Theorem 11.10. *Every continuous function f on $[a, b]$ is integrable.*

Theorem 11.11. *If f is integrable on $[a, b]$, then $|f|$ is integrable on $[a, b]$ and*

$$\left| \int_a^b f \right| \leq \int_a^b |f|$$

.

Theorem 11.12. *If f is a piecewise continuous function or a bounded piecewise monotonic function on $[a, b]$, then f is integrable on $[a, b]$.*

Theorem 11.13 (IVT for integrals)**.** *If f is a continuous function on $[a, b]$, then for at least one x in (a, b) we have*

$$f(x) = \frac{1}{b - a} \int_a^b f$$

Theorem 11.14 (Dominated Convergence Theorem)**.** *Suppose (f_n) is a sequence of integrable functions on $[a, b]$ and $f_n \to f$ pointwise where f is an integrable function on $[a, b]$. If there exists an $M > 0$ such that $|f_n(x)| \leq M$ for all n and all x in $[a, b]$, then*

$$\lim_{n \to \infty} \int_a^b f_n(x) dx = \int_a^b \lim_{n \to \infty} f_n(x) dx$$

Corollary 11.14.1 (Monotone Convergence Theorem)**.** *Suppose (f_n) is a sequence of integrable functions on $[a, b]$ such that $f_1(x) \leq f_2(x) \leq \cdots$ for all x in $[a, b]$. Suppose also that $f_n \to f$ pointwise where f is an integrable function on $[a, b]$. Then*

$$\lim_{n \to \infty} \int_a^b f_n(x) dx = \int_a^b \lim_{n \to \infty} f_n(x) dx$$

12 Fundamental Theorem of Calculus
